Problem Definition

- **Given** a set of " n " unordered numbers we want to find the " k^{th} " smallest number. (k is an integer between 1 and n).

A Simple Solution

- A simple sorting algorithm like heapsort will take Order of $O(n \lg_2 n)$ time.

Step	Running Time
Sort n elements using heapsort	$O(n \log_2 n)$
Return the k^{th} smallest element	$O(1)$
Total running time	$O(n \log_2 n)$

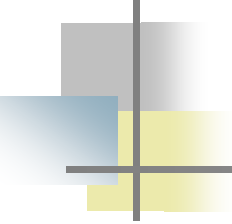

Linear Time selection algorithm

- Also called Median Finding Algorithm.
- Find k^{th} smallest element in $O(n)$ time in worst case.
- Uses Divide and Conquer strategy.
- Uses elimination in order to cut down the running time substantially.

Steps to solve the problem

- Step 1: If n is small, for example $n < 6$, just sort and return the k^{th} smallest number in constant time i.e; $O(1)$ time.
- Step 2: Group the given number in subsets of 5 in $O(n)$ time.

- 
-
- Step3: Sort each of the group in $O(n)$ time. Find median of each group.
 - Given a set
(.....2,5,9,19,24,54,5,87,9,10,44,32,21
,13,24,18,26,16,19,25,39,47,56,71,91,6
1,44,28.....) having n elements.

Arrange the numbers in groups of five

..... (2) (54) (44) (4) (25)

..... (5) (5) (32) (18) (39)

..... (9) (87) (21) (26) (47)

..... (19) (9) (13) (16) (56)

..... (24) (10) (2) (19) (71)

Find median of $N/5$ groups

..... (2) (5) (2) (4) (25)

..... (5) (9) (13) (16) (39)

..... (9) (10) (**21**) (18) (47)

..... (19) (54) (32) (19) (56)

..... (24) (87) (44) (26) (71)

Median of each group

Find the Median of each group

Find m , the median of medians

Find the sets L and R

- Compare each $n-1$ elements with the median m and find two sets L and R such that every element in L is smaller than m and every element in R is greater than m .

$$3n/10 < L < 7n/10$$

$$3n/10 < R < 7n/10$$

Description of the Algorithm step

- If n is small, for example $n < 6$, just sort and return the k the smallest number. (Bound time- 7)
- If $n > 5$, then partition the numbers into groups of 5. (Bound time $n/5$)
- Sort the numbers within each group. Select the middle elements (the medians). (Bound time- $7n/5$)
- Call your "Selection" routine recursively to find the median of $n/5$ medians and call it m . (Bound time- $T_{n/5}$)
- Compare all $n-1$ elements with the median of medians m and determine the sets L and R , where L contains all elements $< m$, and R contains all elements $> m$. Clearly, the rank of m is $r = |L| + 1$ ($|L|$ is the size or cardinality of L). (Bound time- n)

Contd....

- If $k=r$, then return m
- If $k < r$, then return k^{th} smallest of the set L .(Bound time $T_{7n/10}$)
- If $k > r$, then return $k-r^{\text{th}}$ smallest of the set R .

Recursive formula

- $T(n) = O(n) + T(n/5) + T(7n/10)$

We will solve this equation in order to get the complexity.

We assume that $T(n) < C * n$

$$T(n) = a * n + T(n/5) + T(7n/10)$$

$$C * n \geq T(n/5) + T(7n/10) + a * n$$

$$C * n \geq C * n/5 + C * 7n/10 + a * n$$

$$C \geq 9C/10 + a$$

$$C/10 \geq a$$

$$C \geq 10 * a$$

There is such a constant that exists....so $T(n) = O(n)$

Why group of 5 why not some other term??

- If we divide elements into groups of 3 then we will have
 $T(n) = O(n) + T(n/3) + T(2n/3)$ so $T(n) > O(n)$
- If we divide elements into groups of more than 5, the value of constant 5 will be more, so grouping elements in to 5 is the optimal situation.
